

# Validation of Satellite-Derived Cloud Properties Using TC4 Data

P. Minnis, L. Nguyen, W. L. Smith

LaRC, Hampton, VA

K. Ayers, C. R. Yost, M. Nordeen,  
R. Palikonda, D. Spangenberg

SSAI, Hampton, VA

M. McGill

NASA GSFC, Greenbelt, MD

A. Heymsfield

NCAR, Boulder, CO

*2007 AGU Fall Meeting*

*11 December 2007*

# Objectives

- Validate & improve passive satellite retrievals of cloud properties
- Provide context for in situ measurements
- Determine large-scale optical and physical properties (time and space) of tropical convective cells

# Data

- Satellite

- GOES-12, (4-km, 15 min)
- Terra & Aqua MODIS (1-km, 2/day)

- Aircraft

- ER-2 (CPL)
- DC-8 ()

# CERES-MODIS Cloud Retrieval Methodology.

*(Apply CERES algorithms to MODIS & GOES imager data)*

**1) Apply cloud mask**

*see Minnis et al. (2007a), Trepte et al. (2007)*

**2) Compute ice & water phase solution, select most likely phase based on temperature, model fits, LBTM classification, 2.1- $\mu\text{m}$  reflectance**

**DAY: Visible Infrared Solar-Infrared Split-Window Technique (VISST)**

*0.65, 3.8, 10.8, & 12.0  $\mu\text{m}$*

*see Minnis et al. (1995, 1998, 2007b)*

**NIGHT: Solar-infrared Infrared Split-Window Technique (SIST)**

*3.8, 10.8, & 12.0  $\mu\text{m}$*

*see Minnis et al. (1995, 1998, 2007b)*

# Imager Cloud-Top Height Estimation

**Observed 11- $\mu\text{m}$  radiance:**

$$L = (1 - \epsilon) L_s + \epsilon L_{\text{eff}}$$

**Corresponding effective cloud temperature:**

$$T_{\text{eff}} = B^{-1}(L_{\text{eff}})$$

**For high clouds:**

$$Z_{\text{eff}} = Z(T_{\text{eff}})$$

$Z(T)$  - sounding from GFS

**For low clouds:**

$$Z_{\text{eff}} = (T_{\text{eff}} - T_o) / \Gamma + Z_o$$

$Z_o$  = surface height above sea level,  $T_o$  = skin temp,  $\Gamma = -7.1\text{K/km}$

is adjusted between 700 & 500 hPa so that  $T_{500} = T_{500}(\text{GFS})$

*(Minnis et al., JAM, 1992; TGARS, 2008)*

**For optically thick & water clouds,**

$$Z_{\text{top}} = Z_{\text{eff}}$$

**For optically thin ice clouds,**

$$Z_{\text{top}} = Z(T_{\text{eff}}, \tau)$$

*(Minnis et al., JAS, 1991)*

# If a Google-Earth display is desired...

The screenshot shows the Langley TC4 Satellite Page. At the top, there is a navigation bar with links for ABOUT NASA, LATEST NEWS, MULTIMEDIA, MISSIONS, MIT NASA, and WORK FOR NASA. Below this is a blue sidebar with the following links: + NASA Home, + NASA LaRC Home, + Science Directorate, + Clouds and Radiation, Langley TC4 Satellite Page (with sub-links - Langley TC4 Home and + NASA-ESPO TC4 Home), + GOES SATELLITE IMAGERY, + GOES CLOUD PRODUCTS, + MODIS CLOUD PRODUCTS, + SATELLITE PREDICTION TOOLS, + GOOGLE EARTH KML FILES (highlighted), + ER-2 FLIGHT TRACK, + DC-8 FLIGHT TRACK, + WB-57 FLIGHT TRACK, + ALL FLIGHT TRACK, and + CLD PRODUCTS ALONG TRACK. The main content area is titled "GOOGLE EARTH KML FILES" and contains the following text: "The KML files below provide 3D visualization of satellite imagery, product, and prediction using Google Earth application. Google Earth is supported on MAC, PC, or Linux platform and can be downloaded from Google Earth website." Below this is a section "Download and save the KML file to local disk:" with a list of links: + GOES-12 Derived Cloud Products over TC4 region (real-time data disabled), + Calipso Ground Track (sensor) over TC4 region (real-time data disabled), + GOES-12 Raw Satellite Imagery over TC4 region (real-time data disabled), and + Global GEO Satellite Composites (real-time imagery active). A section "KML files from other projects:" follows with a link: + PACDEX experiment (real-time imagery disabled). At the bottom left, there is a search box labeled "SEARCH LANGLEY" with a text input field and a "+ GO" button.

# Flight Tracks over GOES-12 Deff Imagery

**DC-8 & ER-2, 24 July 2007**

## Comparison Approach

- Compare in situ and active sensor data with comparable GOES or MODIS retrievals
- Average 4 4-km or 1-km pixels along flight track
  - interpolate in time between images for GOES
  - use 0.5-h for MODIS

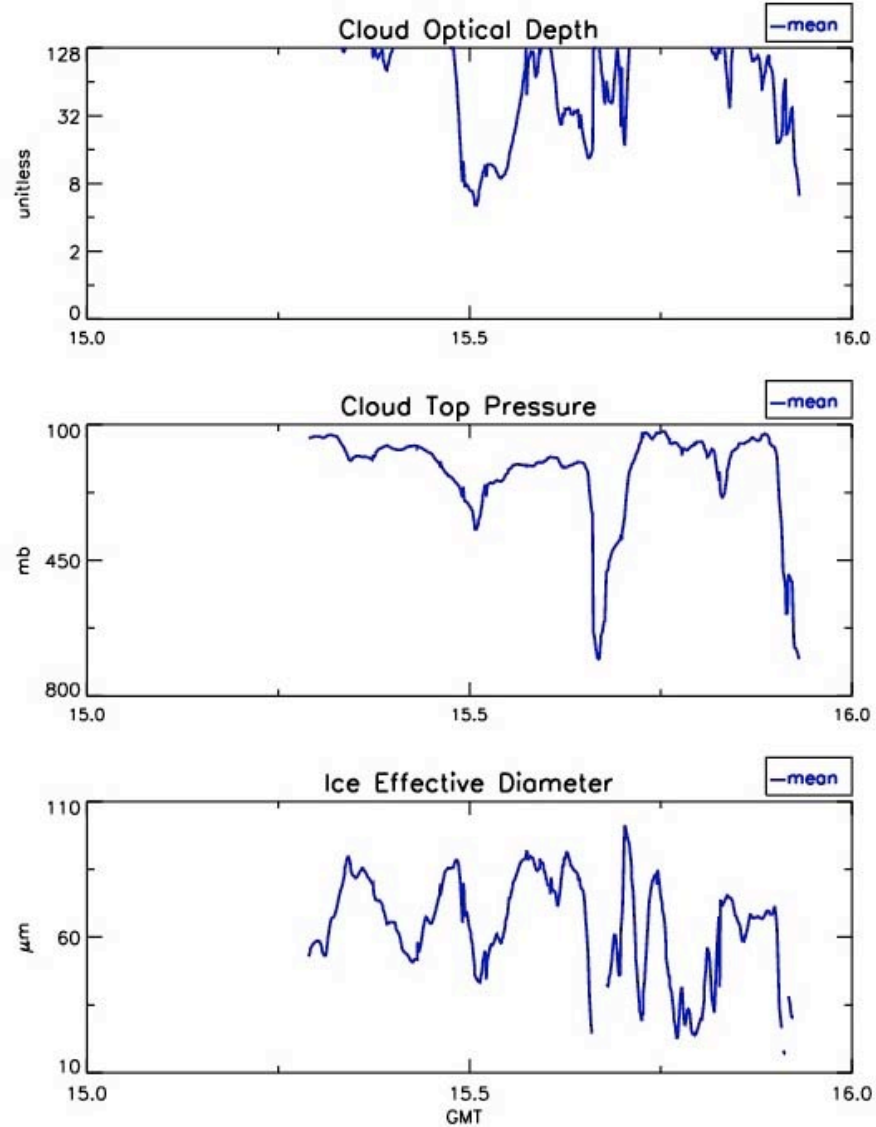

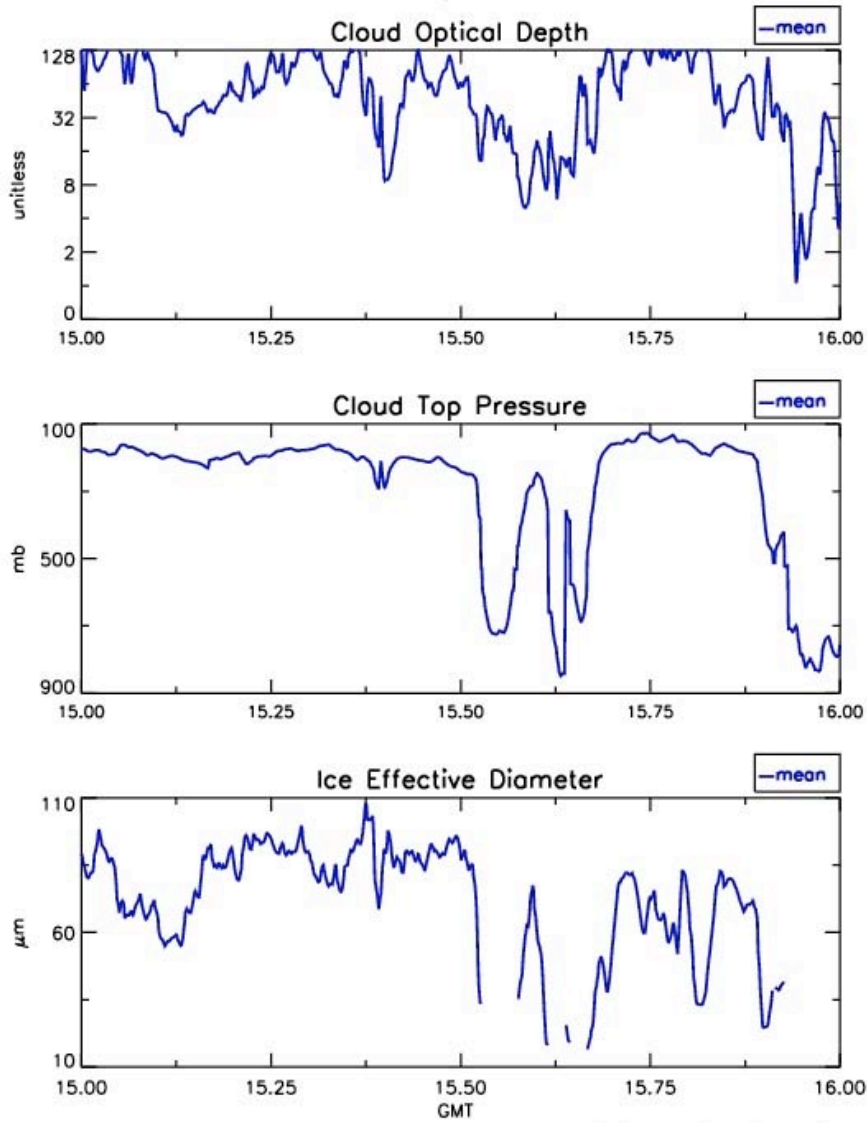

- + NASA Home
- + NASA LaRC Home
- + Science Directorate
- + Clouds and Radiation

GOES or MODIS VISST Derived Cloud Products Along the Aircraft/Calipso Track

GOES/MODIS VISST Derived Cloud Products are computed from the individual aircraft or Calipso navigation files, where the cloud retrieval parameter is based on the weighted average of 4 imager pixels centered on the aircraft location. The (spatial) standard deviation is based on a weighted distribution of the closest pixel and the 8 surrounding pixels.

NASA-Langley GOES-12 VISST Derived Cloud Products  
ER-2 Matched, 24 JULY 2007

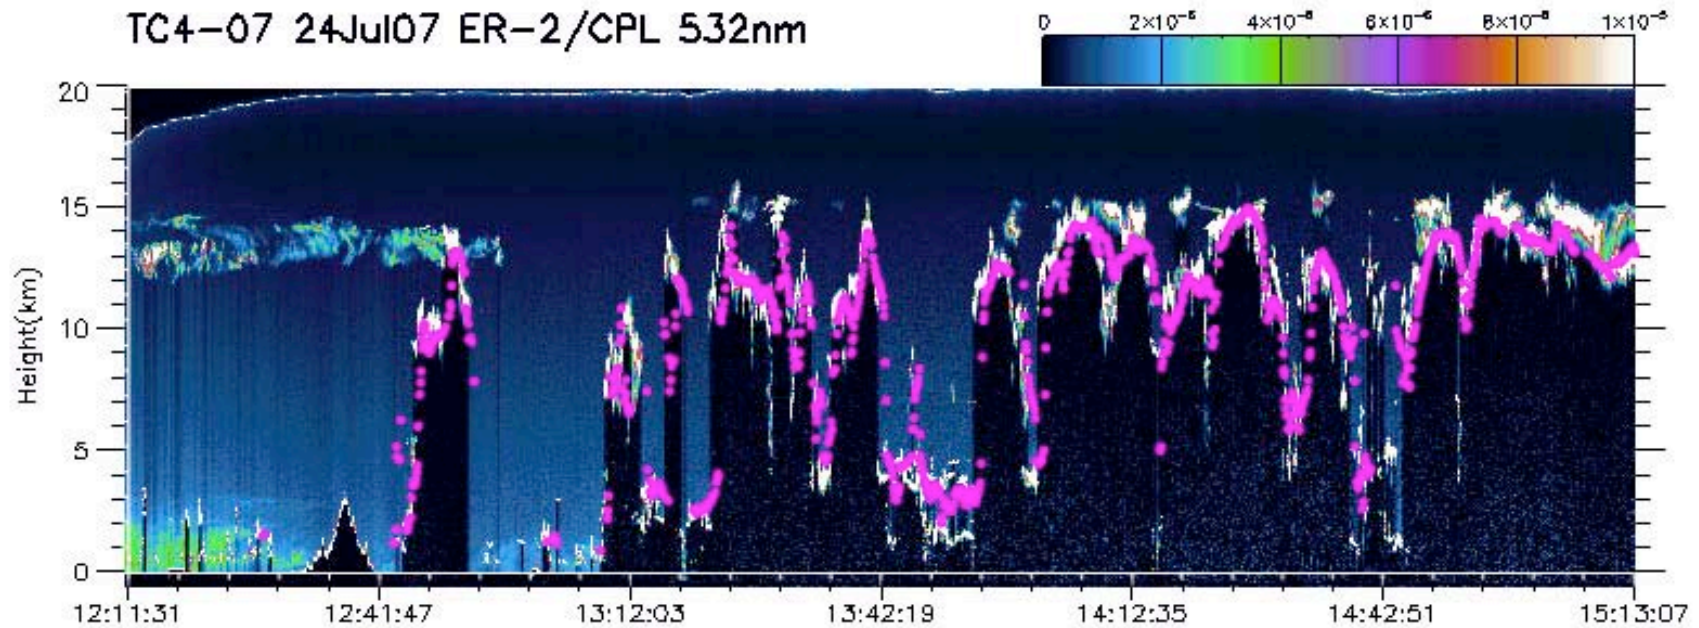

NASA-Langley TERRA VISST Derived Cloud Products  
ER-2 Matched, 24 JULY 2007

End Hour
16.0

# GOES Cloud Top Heights vs ER-2 CPL Backscatter

TC4-07 24Jul07 ER-2/CPL 532nm

# GOES Cloud Top Heights vs ER-2 CPL Highest Heights

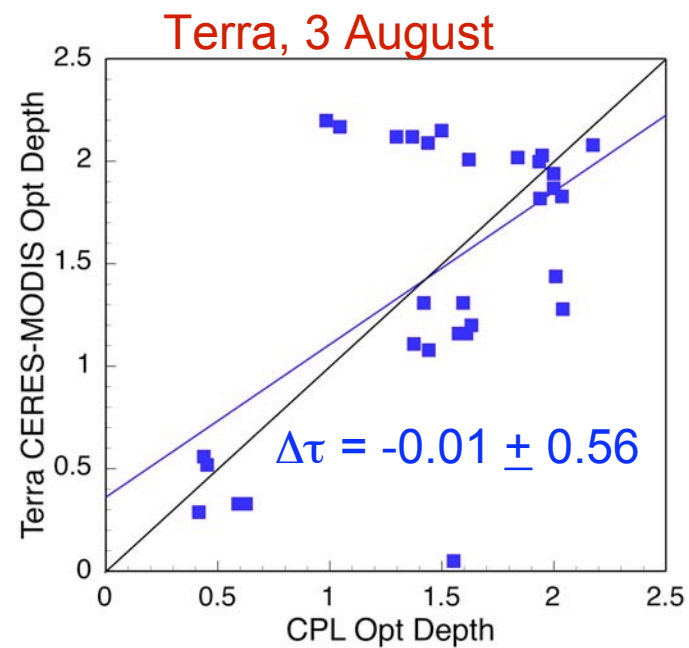

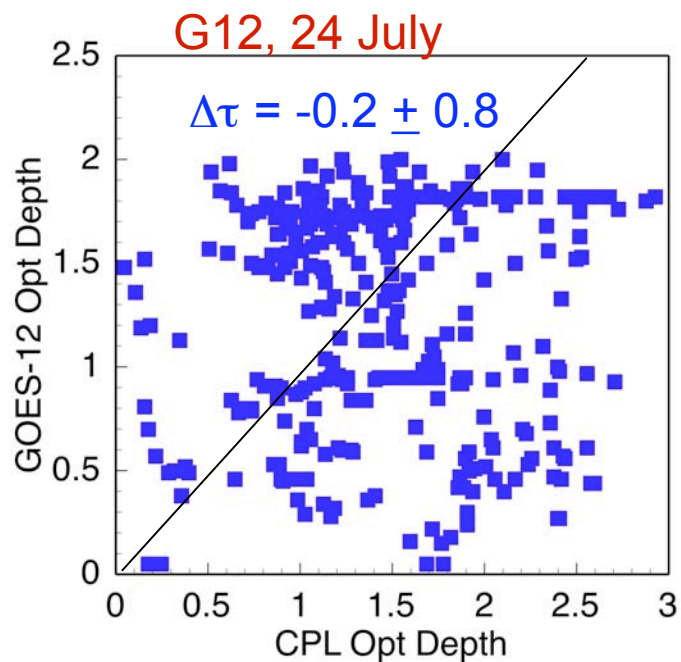

- Some multi-layered clouds induce large discrepancies
- Low cloud heights in good agreement
- High clouds differ by large amounts

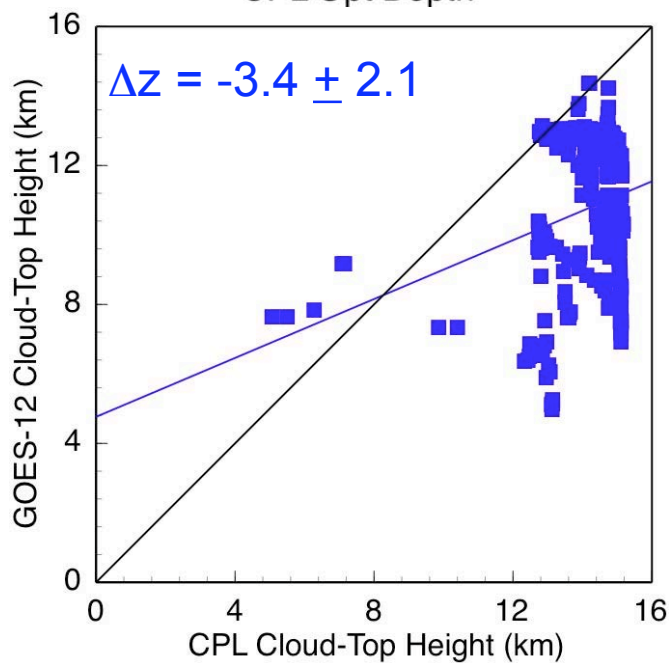

# Thin Ice Cloud Comparisons

Optical depth

Cloud top height

# Multilayer Cloud Detection

Terra VIS, 24 July 07

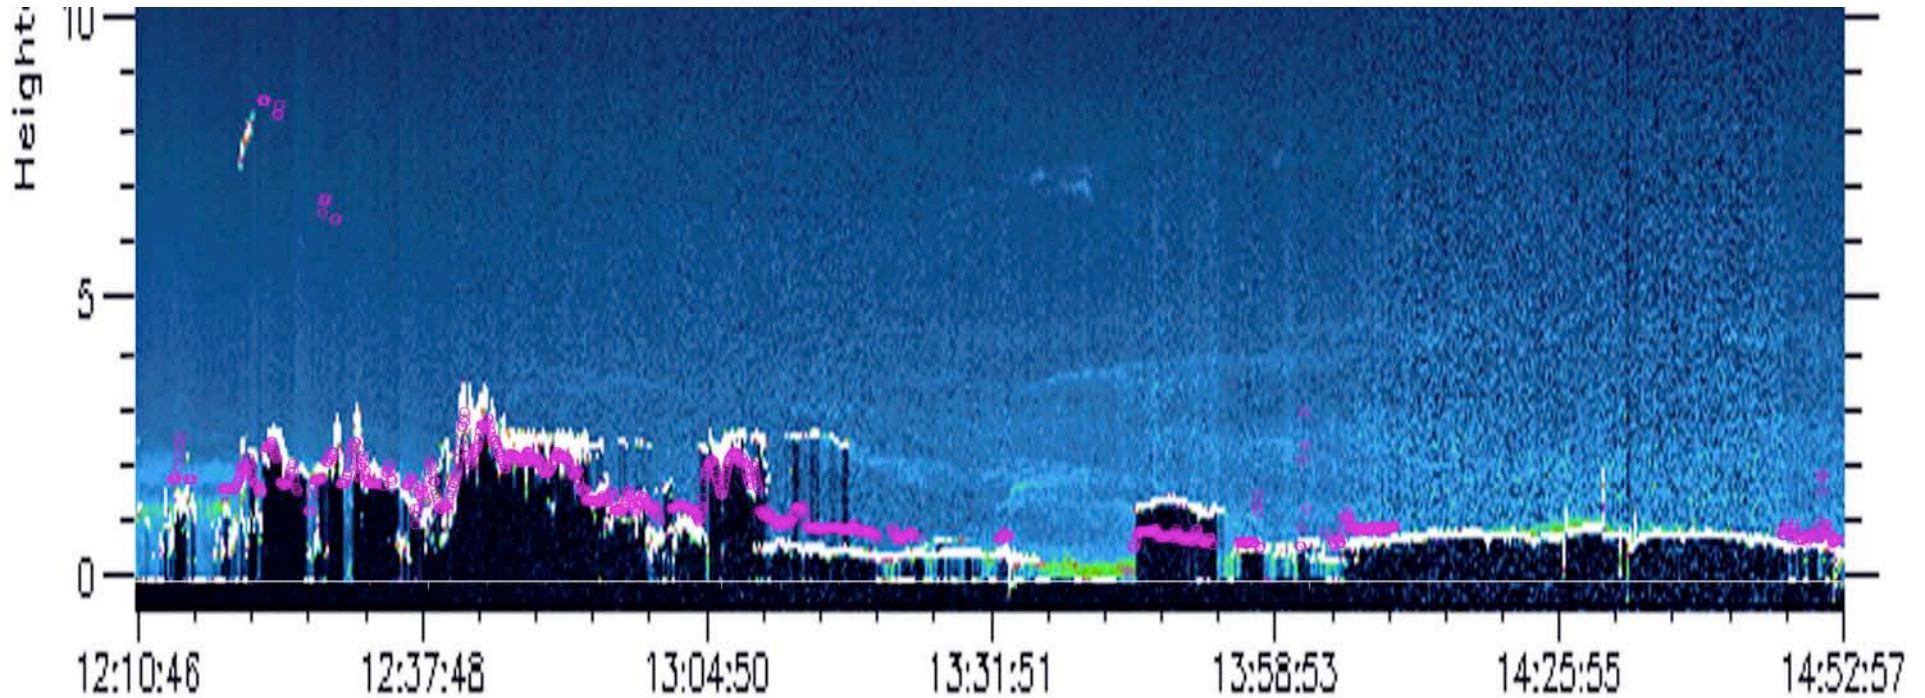

Terra ML Cloud Category, 24 July 07

TC4 data will be used to verify multilayer cloud retrievals using CO2 channel and VISST

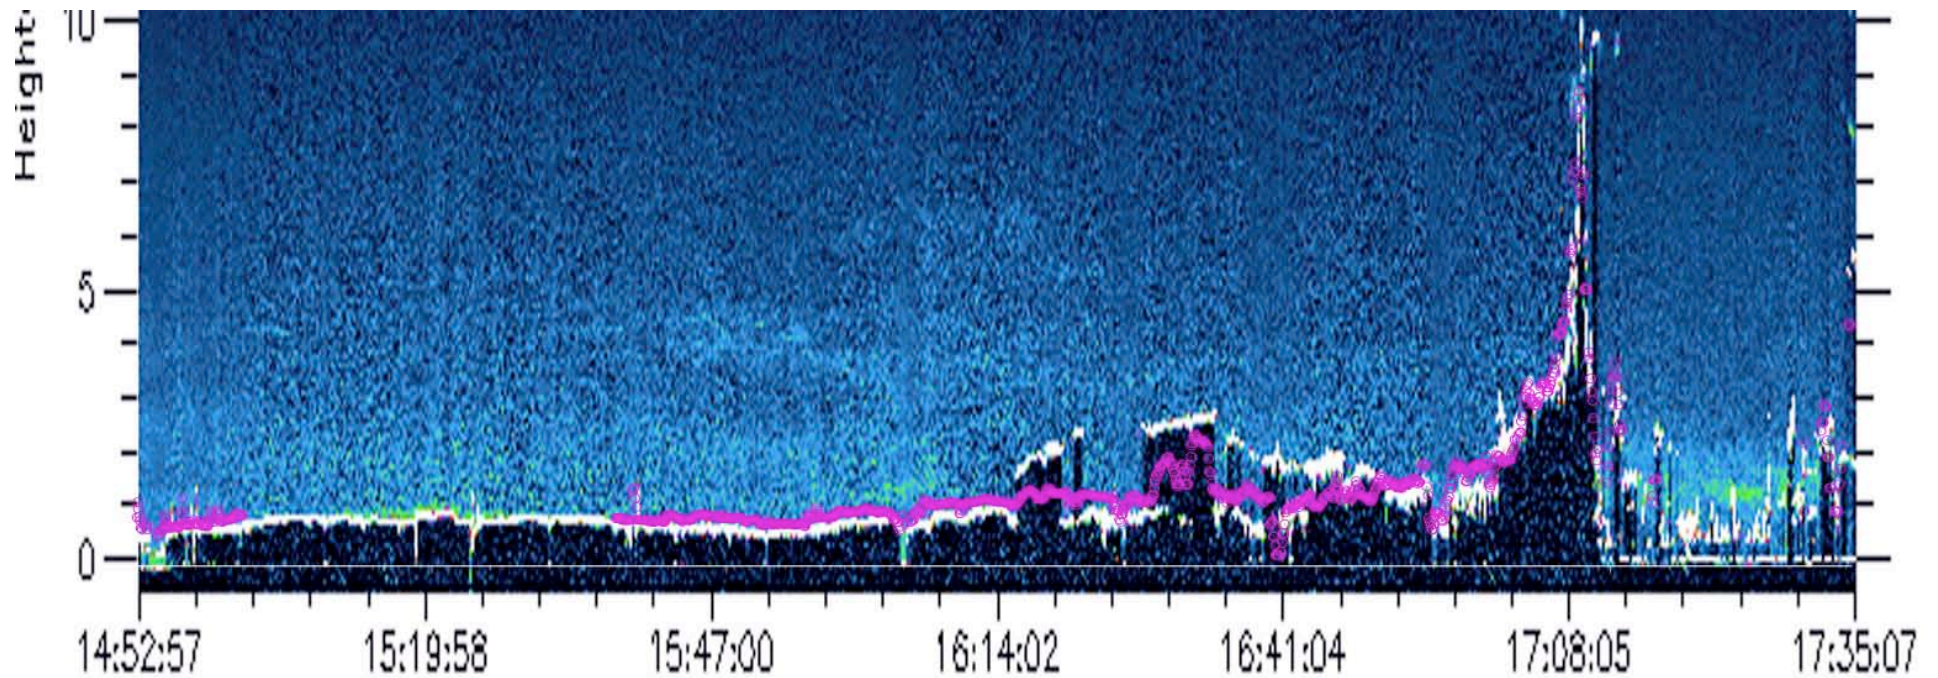

## ER-2 Flight: July 29, 2007

- GOES-derived effective cloud top within a few hundred meters of marine stratus tops

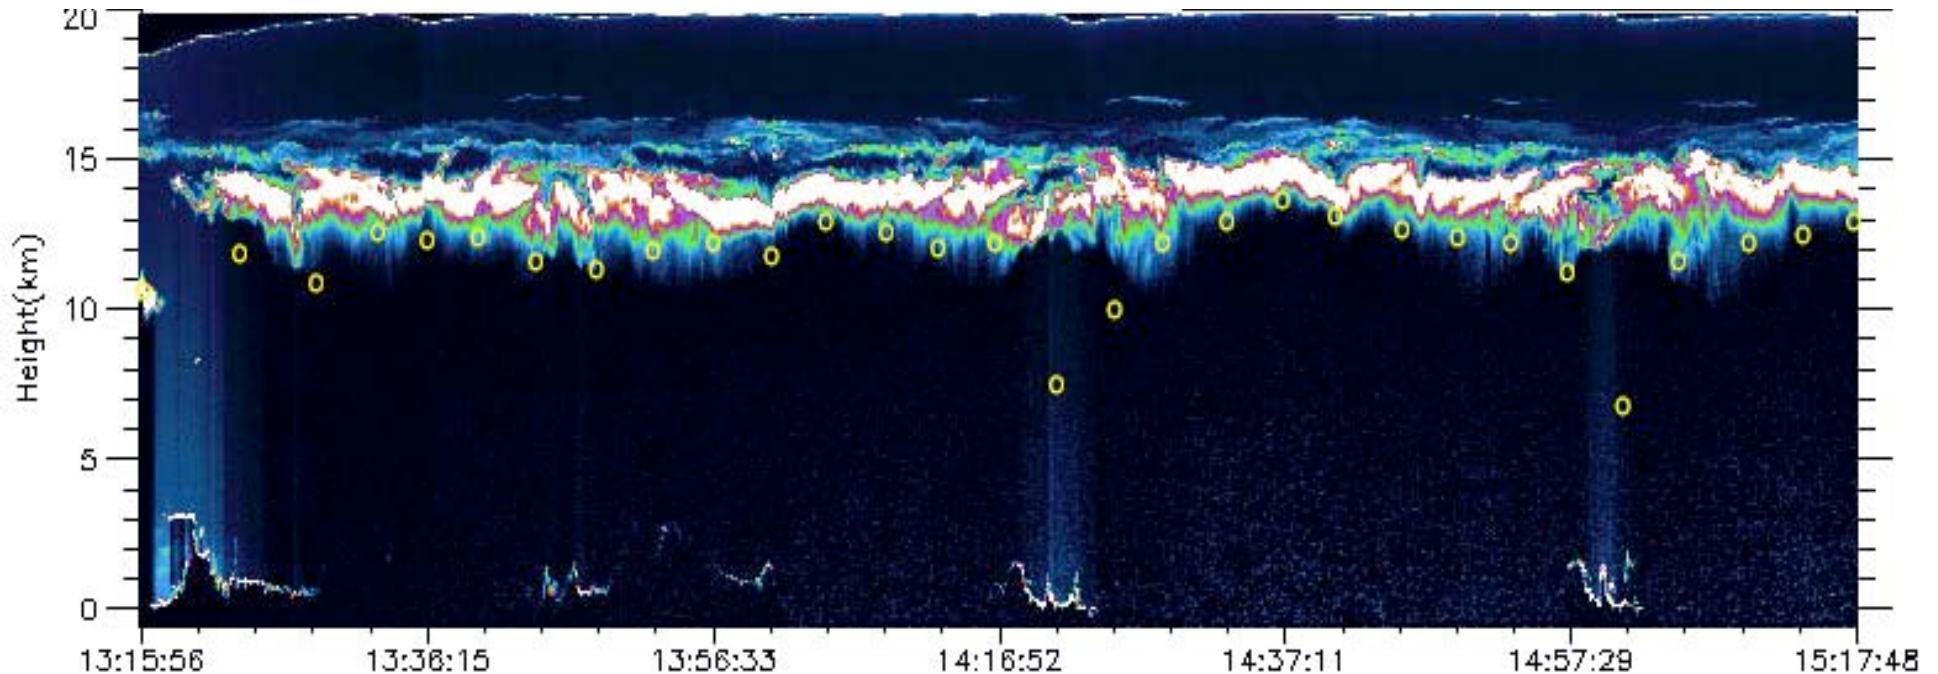

## ER-2 Flight: July 29, 2007

- GOES-derived effective cloud top within a few hundred meters of marine stratus tops in second section also

## ER-2 Flight: July 31, 2007

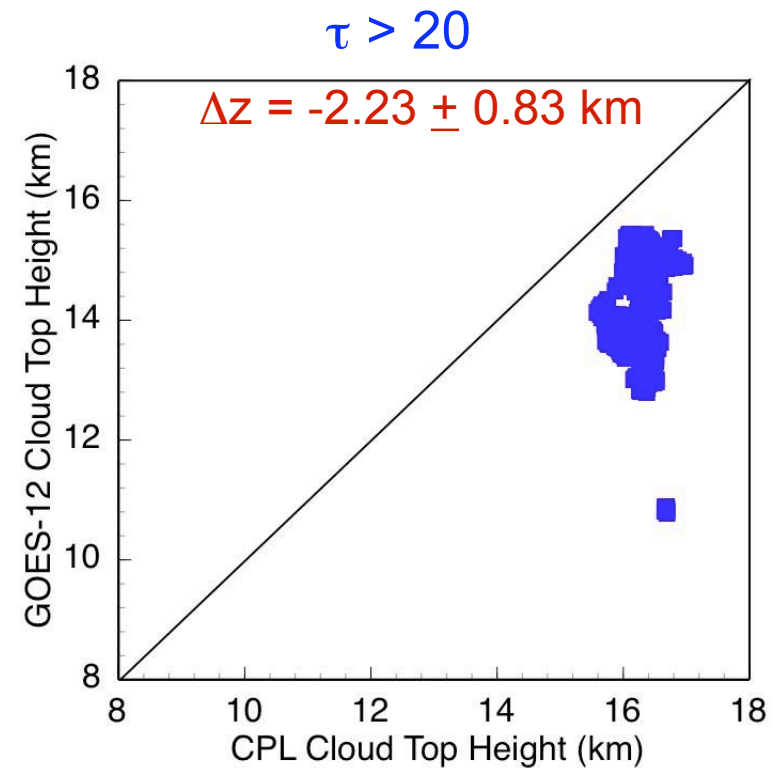

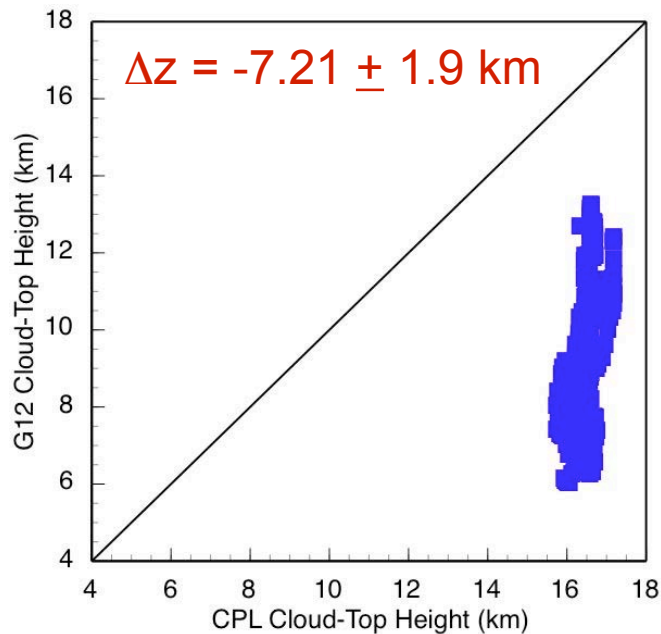

- GOES-derived effective cloud top corresponds to base of lidar penetration in optically thick anvils
- For semitransparent cirrus over low cloud, top is between lower & upper cloud
- ***Need to add 2-3 km to GOES height to find true top***

# Cloud Comparisons, 31 July 2007

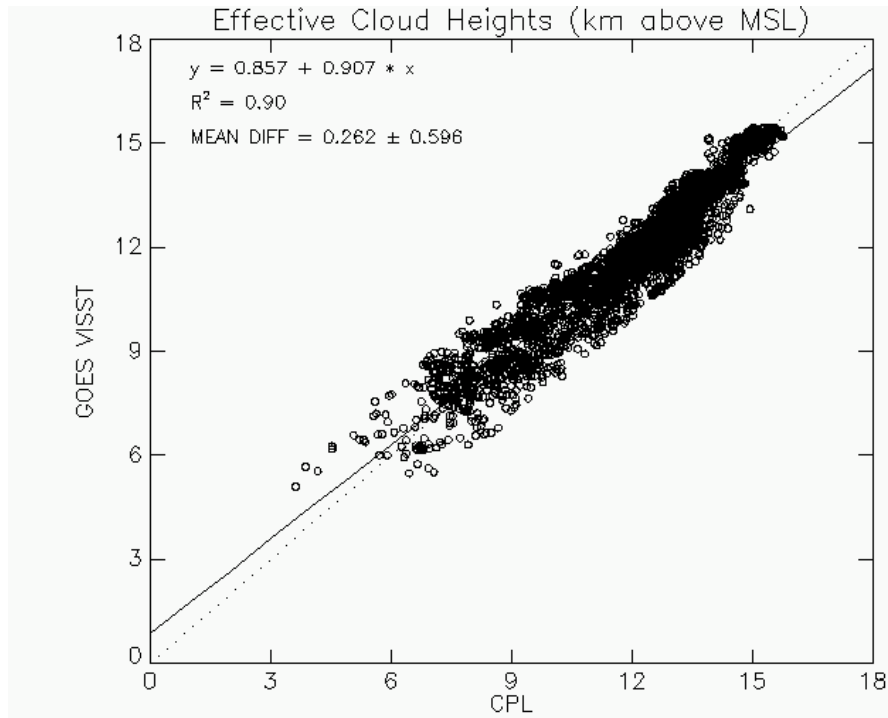

- Optical depth correlation better for GOES
- Underestimate of thin cirrus height worse
- Thick cloud top penetration slightly greater than during CRYSTAL-FACE

# Comparison of Thick Ice-Cloud Heights, GOES vs ER2, TC4

GOES Z(T11) vs height of full attenuation of CPL signal

GOES Z(T11) vs height of first attenuation of CPL signal

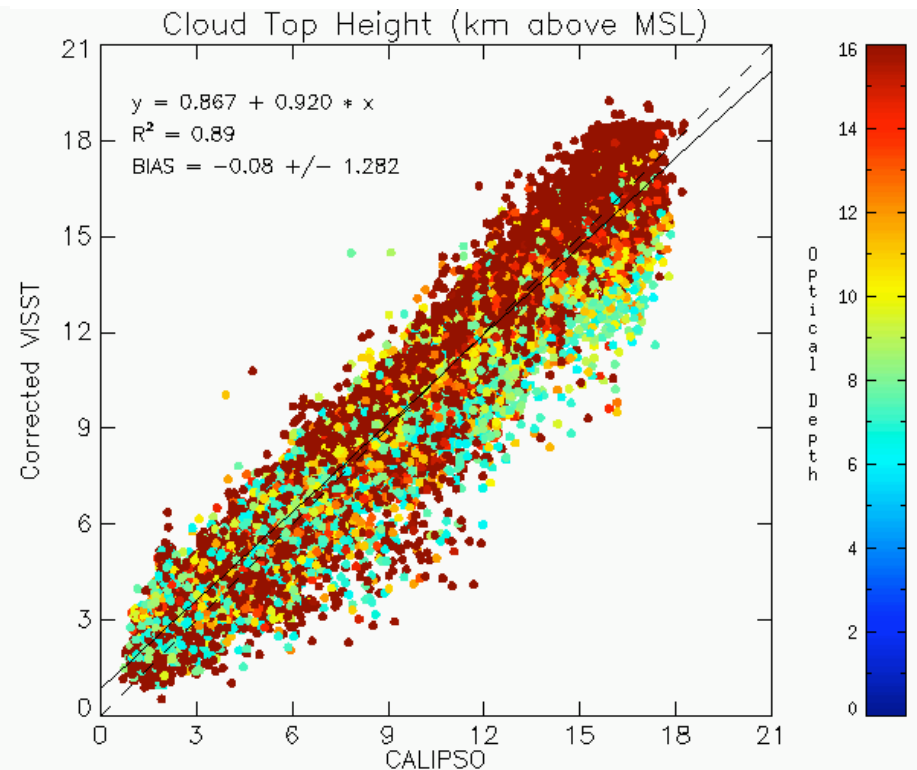

- GOES Teff very close to height of attenuated signal
- Correction need to obtain physical cloud top

# Cloud-Top Height Correction Developed from CALIPSO & Aqua MODIS Data

Comparison of Zeff & CALIPSO Ztop,  
27 April 2006

Comparison of Ztop & CALIPSO Ztop,  
Using 27th Correction, April 2006

- Correction works well with Aqua & CALIPSO

# Before & After Using CALIPSO-based Height Correction

GOES-12  
7/22

Terra  
7/22

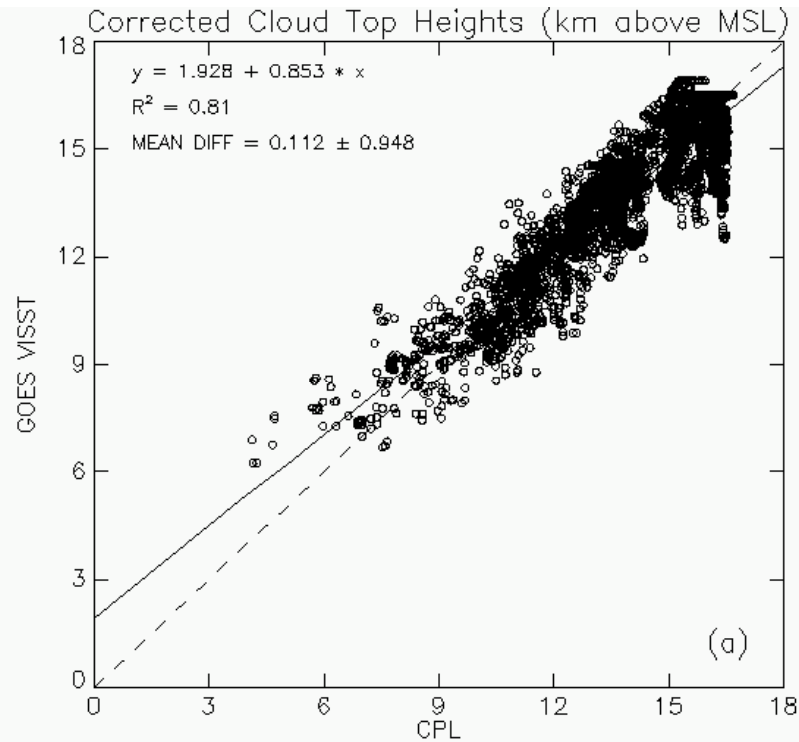

GOES-12  
7/31

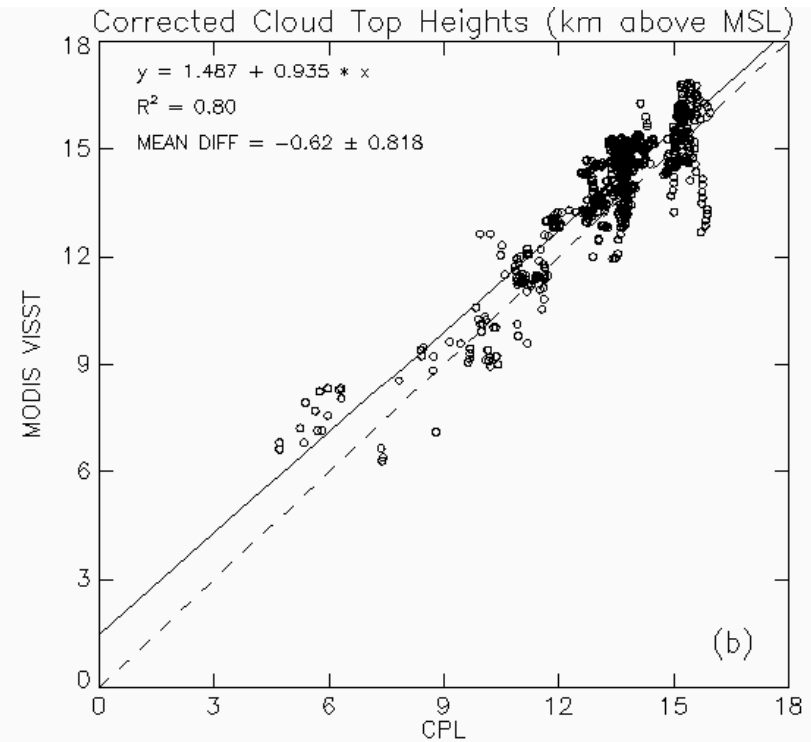

# Comparison of Corrected Cloud Tops With ER2 CPL TC4 Period

GOES-12

MODIS

- GOES correction very effective (near-nadir)
- MODIS correction too much (off nadir), need VZA factor

# Comparison of Cloud Properties from DC-8

3 Aug 2007

Use Integrated Values from Spiral to Compare with GOES Retrievals

## Comparison of Deff and IWP from Aug 3 Spiral

- Good agreement in top of cloud (first 1-2 km)
- In situ IWP =  $391 \text{ gm}^{-2}$ ; GOES IWP =  $312 \text{ gm}^{-2}$

# Summary & Future Research

- TC4 cloud & TOA radiation products available from GOES & MODIS
  - matched with aircraft data
  - high temporal and spatial resolution
- Single-layer low cloud heights within few hundred meters of lidar
- High cloud tops are underestimated
  - thin clouds 3 - 7 km too low (mean tau is good)
    - rougher crystals (?), low-level clouds, VIS-to-IR conversion
  - thick clouds 2.2 km too low
    - new empirical correction looks good
- Data will be reprocessed with new algorithms (\$?)
  - correct for multi-layer clouds
  - correct cloud top heights
  - examine effect of roughened crystals
- More comparisons with ER2, WB-57, DC-8 (\$?)
